

Progress Artifacts Summary

These artifacts document the progression of the project from initial dataset selection to final curation assessment and recommendation development.

1. Project Plan

The project plan established the overall direction of the curation workflow, including:

- project goals,
- dataset selection rationale,
- workflow stages,
- expected deliverables,
- and planned assessment areas related to metadata, provenance, reproducibility, and preservation.

This artifact served as the foundation for organizing the semester-long curation process.

2. Repository Review

The repository review artifact documented:

- repository structure,
- DOI support,
- access mechanisms,
- metadata availability,
- and repository-level preservation observations.

This review helped evaluate how effectively the Dryad repository supports discoverability, citation, and long-term accessibility.

3. Metadata Assessment

The metadata assessment artifact focused on evaluating:

- descriptive metadata quality,
- variable-level explanations,
- documentation completeness,
- file organization,
- and metadata support for independent reuse.

This artifact identified several metadata strengths and documentation limitations affecting interpretability.

4. Article and Dataset Comparison

This artifact compared the deposited dataset with the associated journal article to evaluate:

- alignment between variables and published findings,
- methodological transparency,
- analytical context,
- and dependency on the article for interpretation.

The comparison demonstrated that the article acts as an important interpretive resource for understanding the dataset.

5. Documentation Gap Assessment

The documentation gap assessment identified areas where repository documentation was incomplete or insufficient for independent understanding.

This included:

- missing variable explanations,
- limited preprocessing information,
- incomplete workflow transparency,
- and lack of detailed provenance documentation.

6. Curation Log

The curation log recorded:

- workflow activities,
- observations,
- assessment decisions,
- identified issues,
- and recommendations developed during the project.

This artifact supports transparency and traceability of the curation process.

7. Preliminary Findings

The preliminary findings artifact summarized early observations identified during the repository review and metadata assessment stages. These findings guided the later reproducibility, provenance, and preservation evaluations conducted during the project.

8. Final Report and Recommendations

The final report consolidated all major findings, curation assessments, workflow observations, and recommendations developed throughout the project.

The final recommendations focused on improving:

- metadata quality,
- documentation completeness,
- reproducibility support,
- provenance transparency,
- and long-term reuse of the dataset.

Overall Purpose of the Artifacts

Together, these artifacts demonstrate the progression of the curation workflow and provide evidence of:

- metadata review,
- repository assessment,
- provenance evaluation,
- reproducibility-oriented analysis,
- preservation review,
- and transparency-focused documentation practices.

The collection of artifacts supports the overall CURATE(D)-based assessment process and provides traceable evidence of the work completed throughout the project.
