

Documentation Gaps

During the curation review, I identified several areas where the repository documentation could be improved to better support independent understanding and reuse of the dataset. While the Dryad repository provides strong access and citation support, some important contextual and methodological information is either limited or dependent on the associated journal article.

1. Variable Interpretation Gaps

Several variables use abbreviated or study-specific naming conventions that are difficult to interpret without external context. Some coded values and impulsivity-related measures are not explained clearly within the repository materials themselves.

Examples of Missing Context

- unclear abbreviated column names,
- limited descriptions for coded values,
- missing explanations for derived variables,
- and insufficient clarification of scoring-related fields.

Curation Concern

Researchers unfamiliar with the study domain may misinterpret variables or analytical measures without consulting the publication.

2. Workflow and Transformation Gaps

The repository does not provide detailed documentation describing how the dataset moved from data collection to final analytical form.

Missing Workflow Information

- preprocessing activities,
- data cleaning procedures,
- handling of missing values,
- transformation logic,
- and scoring calculations.

Curation Concern

This limits transparency and reduces the ability of independent researchers to fully evaluate or reproduce the analytical workflow.

3. Dependency on the Associated Article

One major observation during the assessment was that meaningful interpretation of the dataset depends heavily on the associated research article.

Areas Requiring Article Context

- methodological explanations,
- analytical procedures,
- interpretation of behavioral indicators,
- and relationships between variables and findings.

Curation Concern

The repository alone does not fully support standalone understanding of the dataset.

4. Reproducibility Limitations

Although the dataset is openly accessible, the repository lacks sufficient procedural documentation for complete reproducibility assessment.

Missing Reproducibility Information

- analytical workflow notes,
- computational process details,
- transformation lineage,
- and version history information.

Curation Concern

Future researchers may understand the general study purpose but still face difficulty reproducing or independently evaluating parts of the workflow.
